Intro

Trading has always been an opportunity between risk and rewards. Profit favors those who can analyze the market and make the right decision in Risk/Reward ratio. And open a position following the thesis. This is particularly important in the cryptocurrency market where high volatility makes it possible to either triple the deposit in a few hours or lose it in a few minutes.

A large amount of participants, information, regulation and a "black swan" half the world away are short- and long-position opportunities for a trader. BuyCrypt is a tool to convert these chances across crypto exchanges. Our thesis is a convenient user interface, operating speed and mobility.

With BuyCrypt you will be able to trade, copytrade, be in control of your accounts and take assets under management. And these are just the basic utility features. Confidence in the thesis and iterative approach are what we rely on.

The next step is the BuyCrypt development as a major trading ecosystem and launch of BUYT token. The token will be built within 3 stages of attracting investors and the community: Seed Round (strategic investors), Private Round (early investors), Public Round (DEX listings).

In this document we will share the information on the terms of participation at all stages of the IDO BUYT utility token, ecosystem development plans, and investor's rewards.

1.2 About us

A group of enthusiasts spontaneously brought together for solving cryptocurrency-related issues, has retained and increased its staff. Now the team comprises 20 talented developers and marketing experts united by common interests rather than by corporate obligations.

A year of fruitful collaboration has inspired us to extend the range of our activity from trading tools development to collective asset management systems. The Company actively involves partners and builds up the community who we frame our solution.

1.3 Challenges and Solutions

Market Immersion Problems

Regular profit from trading requires complete immersion into the market. A professional trader works full-time every day and carries-out many trades to understand the situation in the market. However, not every intended trader has the possibility to fully immerse into the fast-changing market which urges them to look for turnkey solutions.

A source of information and insights

A large number of trades are carried out through the BuyCrypt platform which allows calculating the trading efficiency and deriving ROE statistics. That gives an idea of the sources of information and allows their ranking. A system member can obtain access to the information while doing good work for the system.

Failure in trading for profit

Access to top-traders

Additional funds

A professional trader can earn more by sharing his expertise. However, he has no opportunity to raise funds. This is a different kind of activity that requires quite different skills and abilities.

Copytrading commissions

Users can pay for winning trades copying. The BuyCrypt system helps those without access to knowledge on how to trade at a profit by providing them with the access to the trades of high performing traders. A trader has only to enter the position-sharing mode. The system will propose the assets to duplicate the trades upon indicators of effectiveness. For a trader it may become an additional profit with no responsibility for assets of the others.

1.4 BuyCrypt Key advantages

The accumulation system of lucrative rewards for best traders. Unlike the subscription model, BuyCrypt uses the model of payments to traders according to the amount of profit delivered to all participants.

This approach motivates best traders to join the system whereby the best traders raise more assets. The BuyCrypt model is designed so that best traders get the maximum profit while the asset holders get the high usage efficiency.

1

Mobile Trading

2

Copytrading

BuyCrypt displays the information about the efficiency of traders willing to share their positions. It makes it possible to decide on the source for copying based on the efficiency and terms.

3

Paying for Profit Alone

Commissions are only paid in case of winning trade copying (winning copytrade). The commission for copytrading is paid only in case of positive ROE. In case of negative ROE, you keep your BUYT tokens.

4

Multi-account Management

Professional traders often have a lot of accounts across Exchanges. To simplify the management of all accounts a convenient solution on management from one terminal has been developed. It allows running several strategies simultaneously or duplicating the basic one.

5

Transfer for Trust Management

Alongside sharing/copying positions, BuyCrypt is going to deliver a solution for transferring the account to another trader for trust management. The authorized person may trade on behalf of the account owner without transfer of overall account management.

1.5 Roadmap

Plans for the future

After implementing the v1 protocol and its debugging in the market, the BuyCrypt team has aimed at working out a complete DeFi solution. It will allow mitigating losses by consolidating the knowledge of many traders.

The mechanism for implementing well-balanced solutions based on the fair rewards system in proportion to the deposit. Such an approach will lead to the most profitable use of assets, which will be financially attractive and accumulate more of these in the decentralized v2 protocol.

BUYT IDO

2.1 BUYT utility

Access to full functionality

Apart from speculative interest, the token holder will have access to extended BuyCrypt functionality.

Access to Top traders

With tokens being accumulated, there opens access to better traders which allows gaining profit more efficiently.

Handling flexibility

The token serves as a buffer between third-party assets and the trader which makes it possible to manage the risks. It allows payment only for winning trades and, in case of a bad trade, the user saves BUYT tokens for the next deal.

The model of payment for winning trades allows deactivation of copytrading at any time and withdrawal of unused tokens. If required to activate again, buy a token and deposit it into a smart contract for copytrading.

Control Over Top-traders access to funds

In the course of mass application, a mechanism is laid in the protocol that limits accumulation in one trader of all assets for copying.

The more tokens you use for copying trades, the more leveraged margin you have. The more tokens you have, the wider access to capital you get.

Rewards

Rewards for token holders.

For trading volume through the BuyCrypt App.

For providing liquidity.

2.2 BUYT implementation

- BUYD – BUYT smart contract deploy
- Limited BUYD distribution (Seed round)
- BUYT smart contract deploy
- Replacing BUYD tokens with BUYT tokens
- Integrating BUYT smart contracts with BuyCrypt platform services
- Listing BUYT on Exchanges

2.3 Circulation / Distributions plans

Networks and Integrations

The BUYT token was initially developed on Binance Smart Chain (BEP-20). Moving forward, it will be replicated on popular chains and, first of all, on blockchains using Solidity (Avalanche Contract Chain (C-Chain), Binance Smart Chain (BSC), Fantom, Polygon). Subsequently, upon users' requests, there will be duplication of contracts for Solana, Cardano, Tron, Polkadot and other popular projects.

The Company has its goal to provide access to the token from popular CEX exchanges and DEX Exchanges so that the user can purchase the token in a convenient way for him.

To allow the user to acquire BUYT on the spot we intend to integrate swap service in BuyCrypt platform interface.

2.4 Protocol Mechanism

History access for holders

Holding a certain amount in token automatically opens access to more successful traders.

Trading Rewards

The protocol accrues rewards for trading through Buycrypt.

Copytrading

The protocol ensures automatic distribution of commissions to traders from all subscribers according to their deposits.

Vesting Contract

The contract unblocks tokens to be traded within a specified time algorithm.

Rewards for BUYT holders

Token holders in their own wallets will be rewarded every quarter.

2.5 Tokenomics

Token general info

Network	BSC (BEP-20)
Supply	200 000 000
Ticker	BUYT

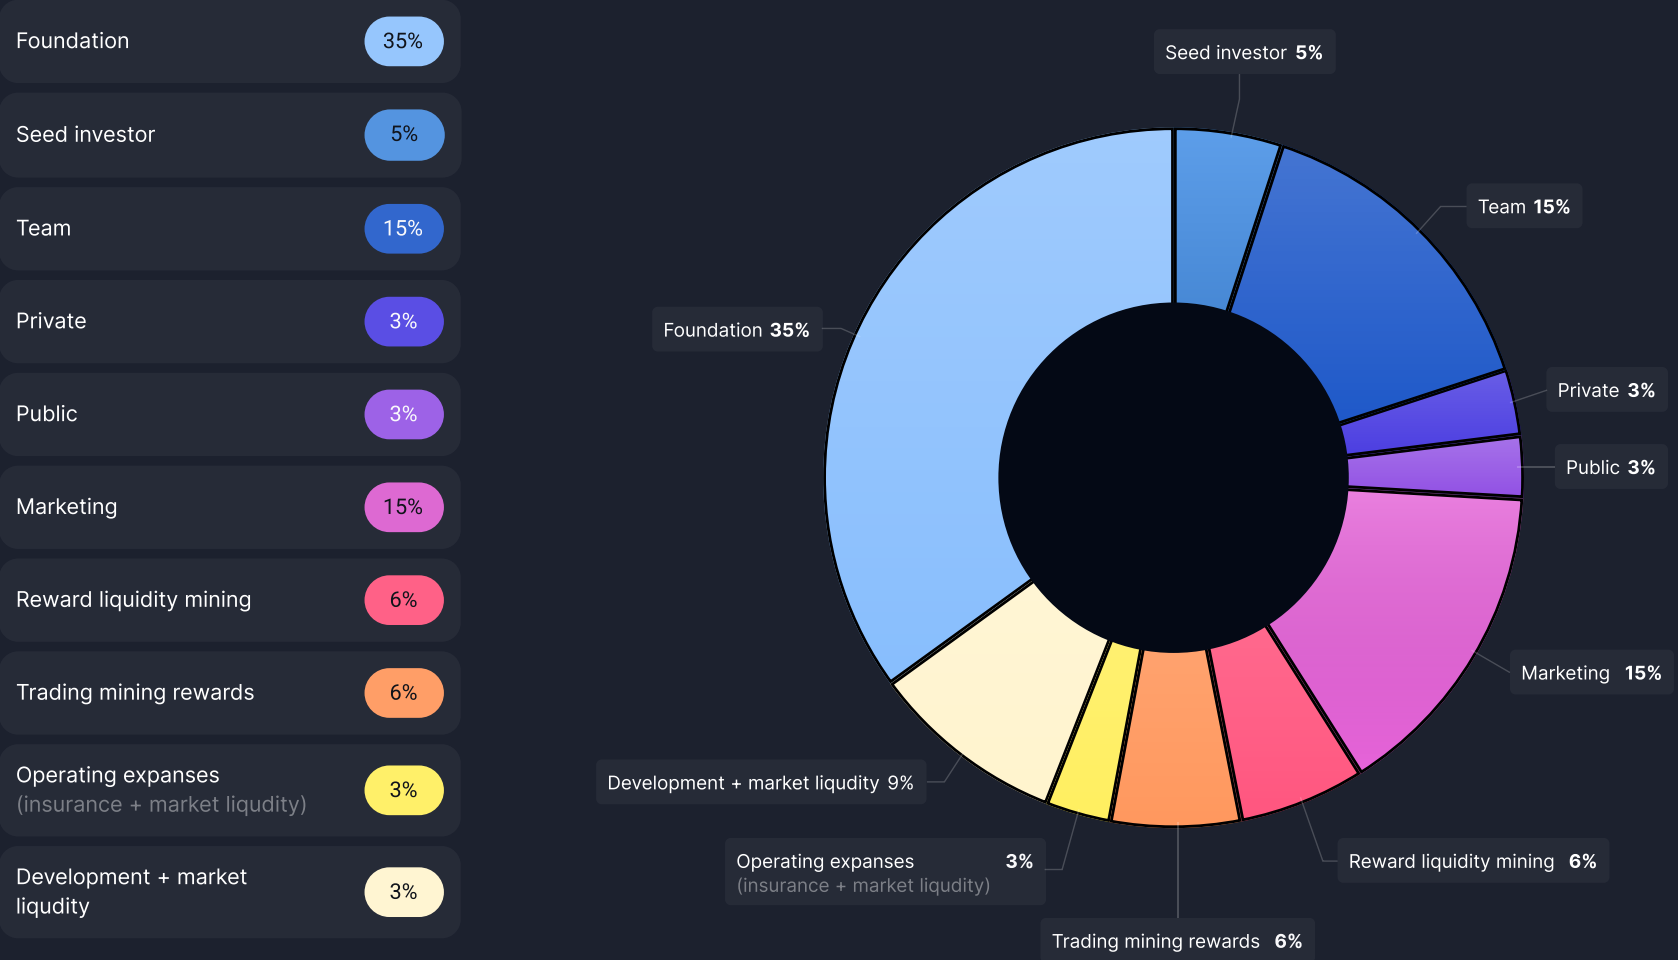

Distribution

Project team	
Seed investor	5%
Team	15%
Sale	
Private Sale	3%
Public Sale	3%
Token deploy	
Marketing	15%
Liquidity mining rewards	6%
Trading mining rewards	6%
Operating expenses	3%
Development and market liquidity	9%
Foundation	35%

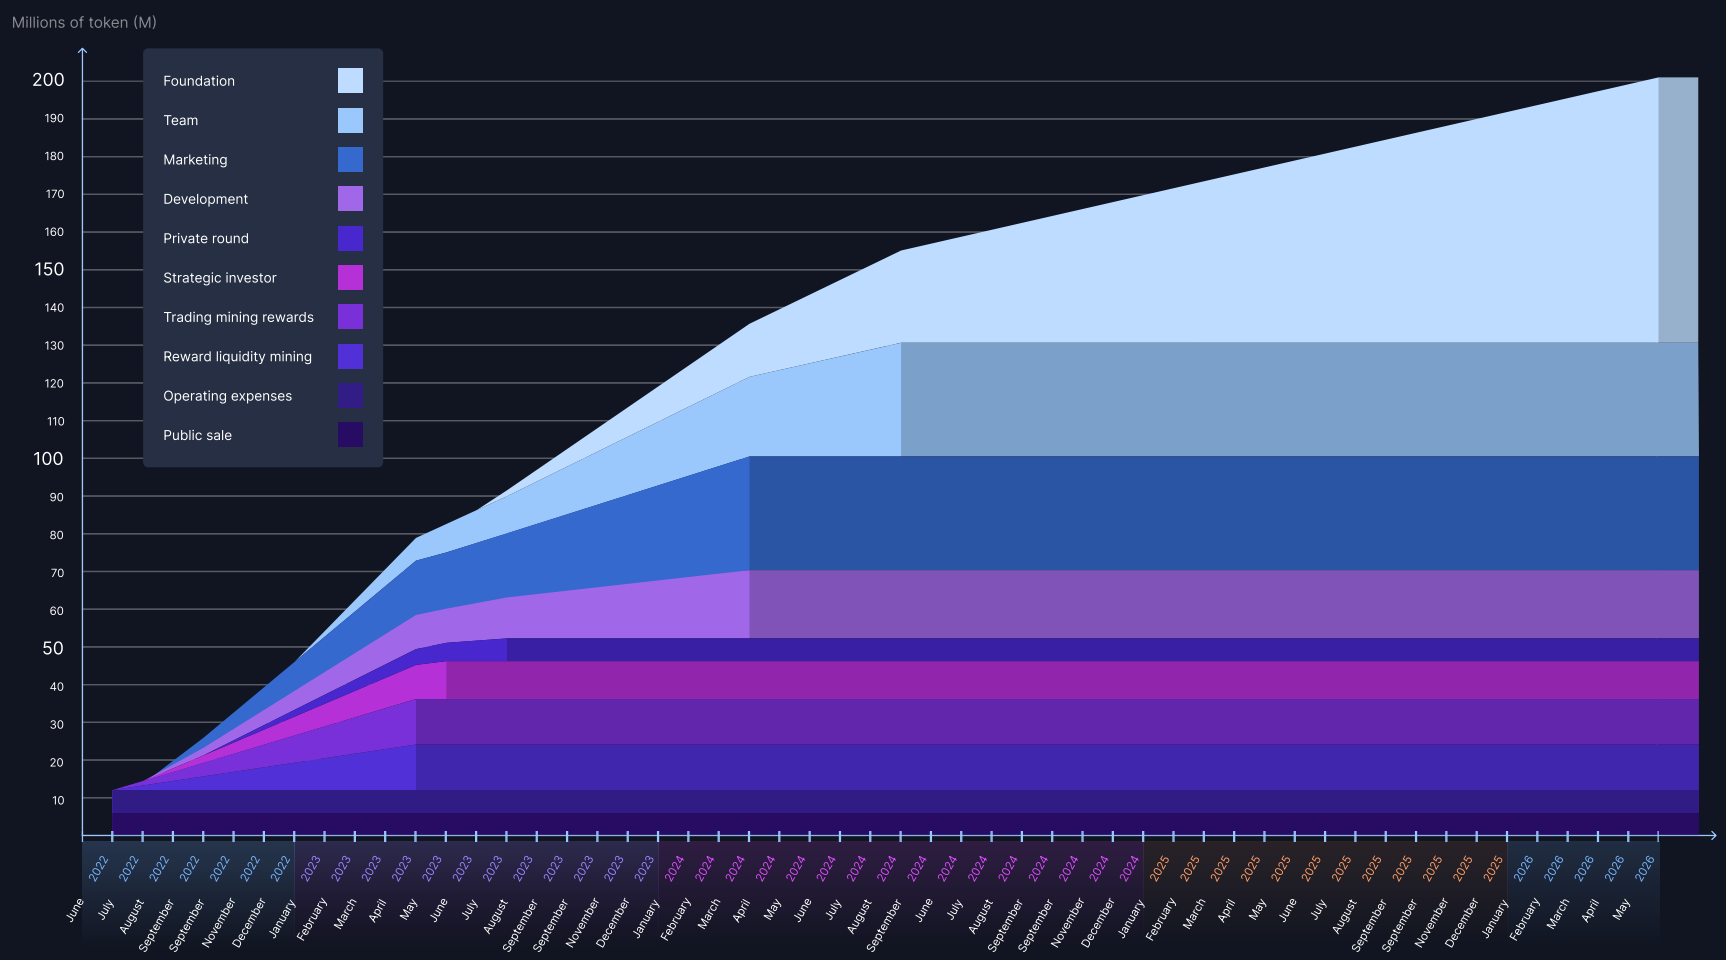

Vestig

	Condition (terms)	BUYT
Strategic investor	1 month cliff, 10 months vesting	10 000 000
Team	6 months cliff, 20 months vesting	30 000 000
Private round	3 month cliff, 10 months vesting	6 000 000
Public sale	Immediate release on listing	6 000 000
Marketing	1 month cliff, 20 months vesting	30 000 000
Liquidity mining rewards	10 months vesting after Public	12 000 000
Trading mining rewards	10 months vesting after Public	12 000 000
Operating expenses	Release on Public	6 000 000
